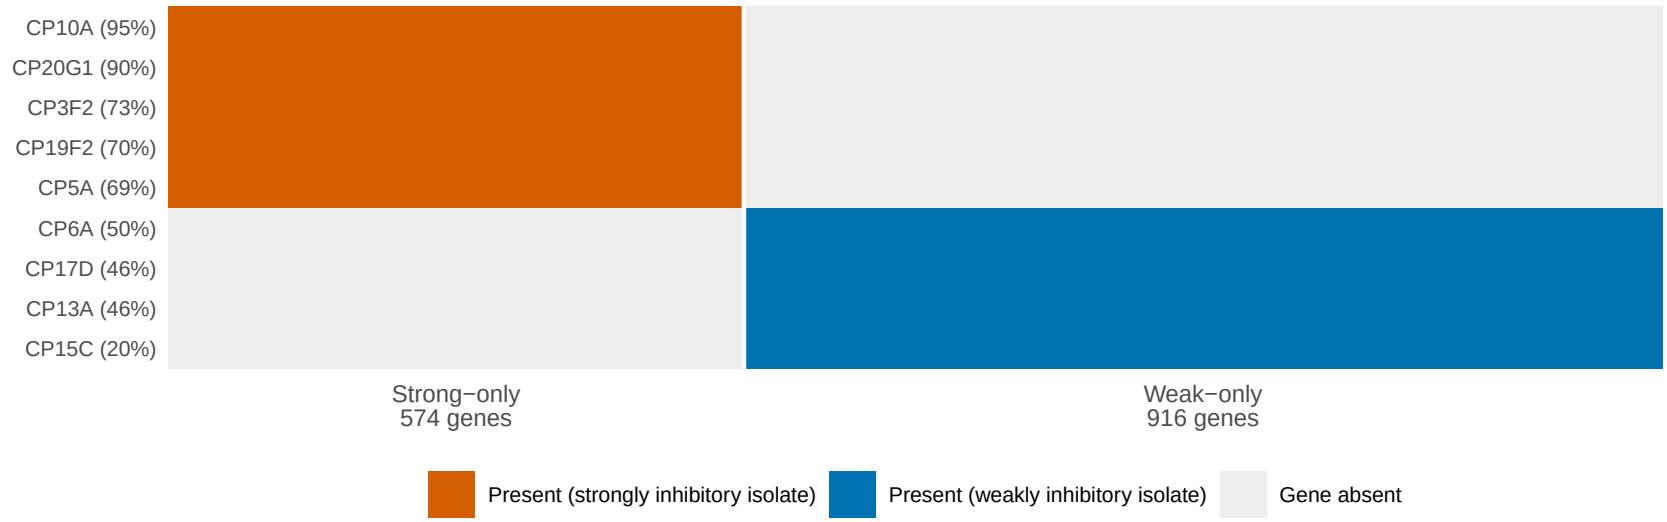
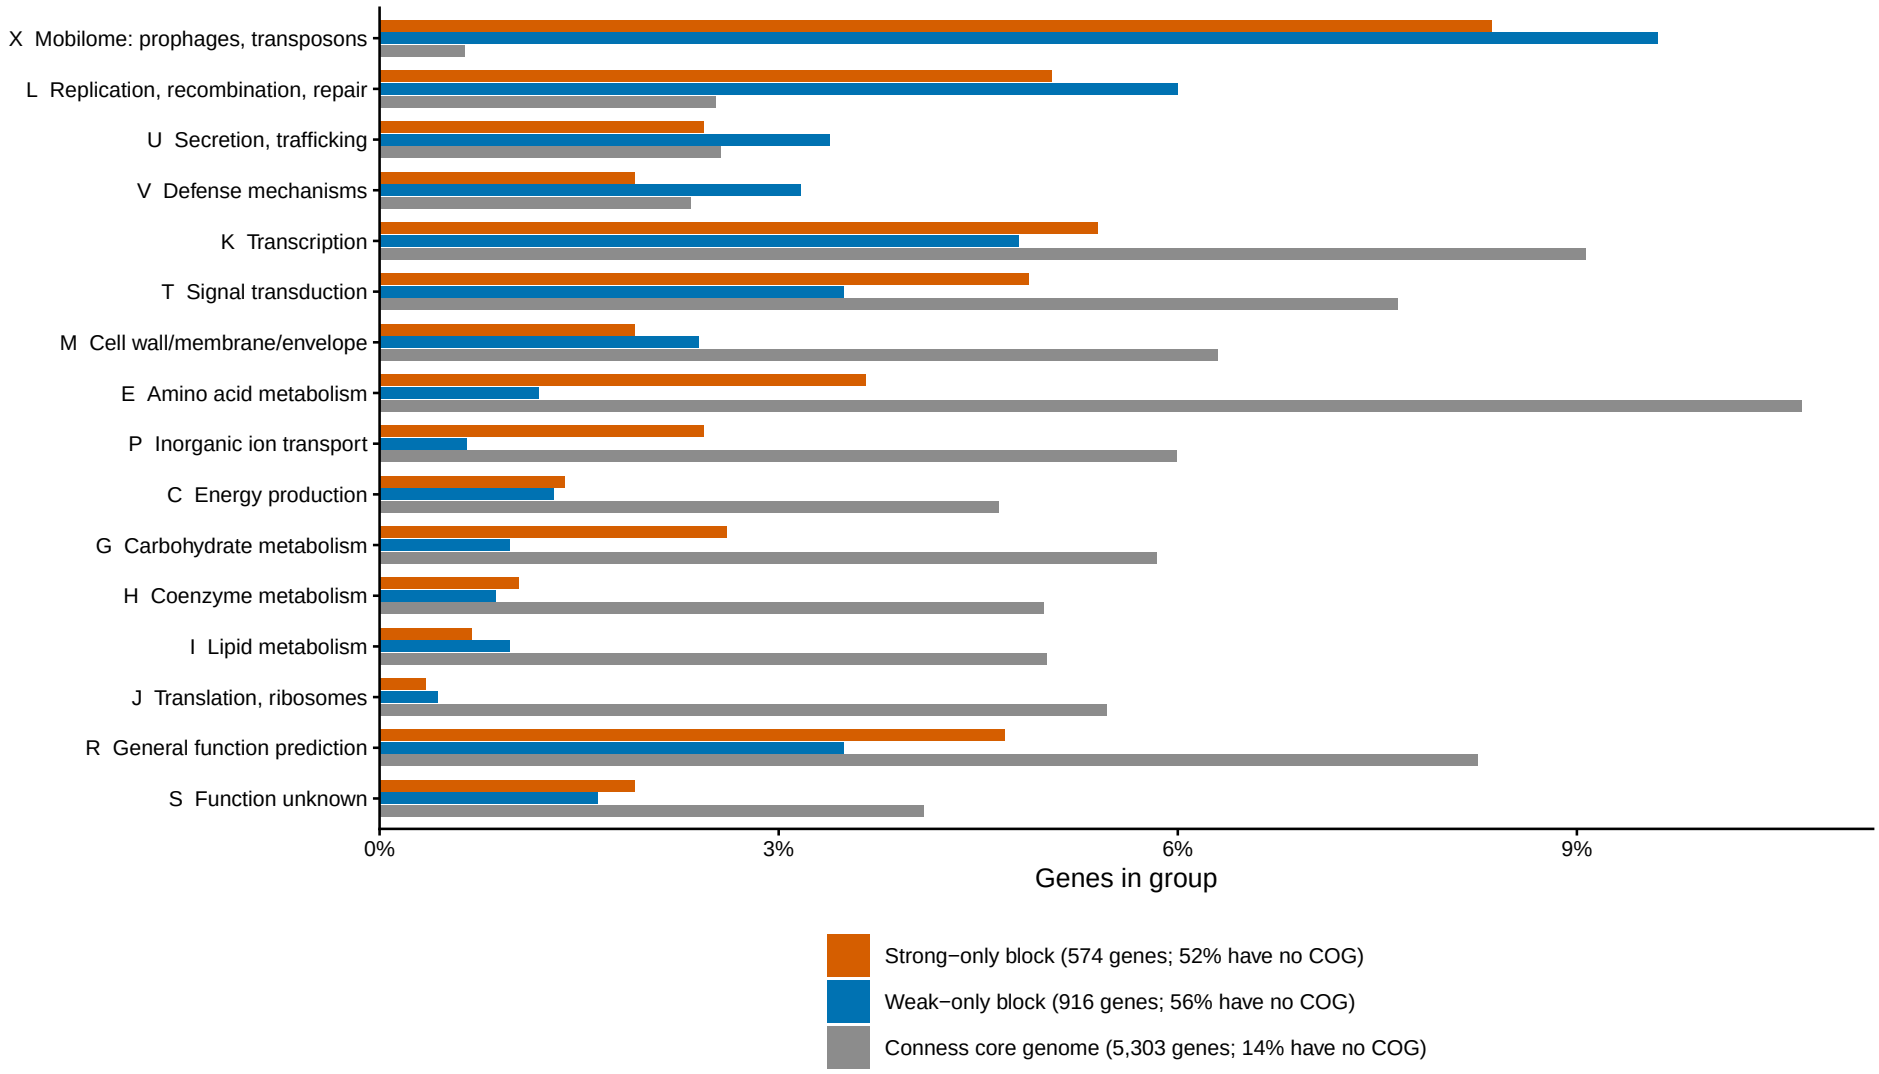
A Gene presence across Conness Pond isolates

1490 of 1495 per−gene Fisher−significant genes form two complete blocks (shown); 5 more follow near−complete splits (one isolate off). Isolates labelled with mean % Bd inhibition (Jel197).



B What the blocks contain: COG functional categories

Percent of all genes in each group assigned to each category (genes with several COG letters count in each)



Per−gene Fisher tests are not independent here: genes sharing a presence pattern give identical results.
Treat the blocks as two lineage−level differences, not ~1,500 separate associations.
