

Divergence of GO terms between strong and weak

log2(% strong / % weak) – positive = more common in strong

symbiont genome ejection through host cell envelope, long flexible tail mechanism

phosphorelay signal transduction system

chromosome segregation

proteolysis

symbiont entry into host cell

negative regulation of DNA-templated transcription

DNA recombination

response to antibiotic

DNA repair

DNA transposition

DNA replication

DNA integration

extracellular region

cell surface

plasma membrane

cytoplasm

cytosol

chromatin

membrane

viral capsid

cell outer membrane

efflux pump complex

virus tail, baseplate

toxin-antitoxin complex

zinc ion binding

metal ion binding

sequence-specific DNA binding

DNA-binding transcription factor activity

ATP hydrolysis activity

phosphorelay sensor kinase activity

phosphorelay response regulator activity

ATP binding

endonuclease activity

hydrolase activity

DNA binding

transposase activity

log2 fold-difference

Enriched in Strong

Enriched in Weak
